

2 Dimensional Arrays. \rightarrow Matrices

we will have rows & columns.

rows \downarrow

| | | | |
|----|----|----|----|
| 1 | 2 | 3 | 4 |
| 5 | 6 | 2 | 8 |
| 9 | 10 | 11 | 12 |
| 13 | 14 | 15 | 16 |

cols \rightarrow

$count < arr$

$count < arr[i]$

$arr[2][2]$
 \downarrow
 2 rows 2 cols.

$2 \times 2 = 4$ buckets

$arr[2][2]$

second bucket or arr error

$arrE[2]$

$= \begin{cases} 1, 2, 4, \\ 2, 4, 4, \end{cases}$

$r=1 \quad c=4$
 $r=2, 3, 4 \quad c=3, 4$

1

2

3

4

| | | | |

| | | | |
| | | | |
| | | | |
| | | | |

X

$$\begin{aligned} r=2, 3, 4 \quad c=3, 4 \\ r=5, \quad c=4 \end{aligned}$$

[] \rightarrow rectangular

In 2D array

arr[i] \rightarrow 2^{nd} bucket of arr (row) (matrix)

arr[i][3] \rightarrow 4^{th} bucket of arr[i]

arr[2] \rightarrow * (arr+2)

arr[2][2] \rightarrow ??

| | | | |
|-----|-----|-----|-----|
| 0,0 | 0,1 | 0,2 | 0,3 |
| 1 | 2 | 3 | 4 |
| 100 | 104 | 108 | 112 |
| 0,0 | 0,1 | 0,2 | 0,3 |

arr[i] \rightarrow In case of 2D arrays.
 \downarrow
 (arr + 1x4x column no.)

or in general sense.

or in general sense.

$$\text{arr}[i] = \left(\text{arr} + i \times \frac{(\text{sizeof datatype}) \times (\text{total columns in a row})}{1} \right)$$

int type 2D array

$$\text{arr}[1] = 100 + 1 \times 4 \times 2 = 108$$

arr \rightarrow 100

$$\text{arr}[1][1] = \text{arr}[0][3]$$

$$\text{arr} + 1 \times 4 \times 2 + 4 = \text{arr} + 12$$

$$\text{arr} + 3 \times 4 = \text{arr} + 12$$
